

### About the Amur Leopard

The amur leopard is classified as a member of the order Carnivora (Carnivores) and is a member of the family Felidae. It is classified as a critically endangered species due to a reduction of at least 80% of its population over the past three generations because of a decline in area of occupancy, extent of occurrence, or quality of habitat. The amur leopard population is also estimated to be less than 50 mature individuals. Amur leopards can be found in eastern Asia.
